

INSTRUCTIONS

#HF-100

HF-100 GRIP SOLVENT

HF-100 Grip Solvent is economical to use. You will use less than other solvents. We recommend the use of a spray bottle to apply **HF-100**.

Apply grip tape to cover the full length of the grip and 1/4" over the butt end of the shaft. Remove the paper carrier. Fold excess tape into the butt end of the shaft.

- 1** Spray **HF-100** onto the grip tape, 1 pump on each side of the shaft.
- 2** Spray **HF-100** inside the grip, 1 pump is sufficient.
- 3** Install the grip by pushing onto the shaft.
- 4** Wipe off the excess **HF-100** with a dry cloth. If you have applied the correct amount of solvent, the excess should be minimal.
- 5** The grip should be set in 15-20 minutes.

NOTE: If you use too much **HF-100**, it can take up to 60 minutes to dry.
